

*Submicron performance
cleans air more thoroughly*

Advanced Nanofiber Filtration Technology for Weld Fume/Smoke

Add the clean-air performance of ProTura® Advanced Nanofiber Filtration Technology to your Lincoln Electric Mobiflex™ 200-M or Mobiflex 400-MS or other brand of weld-fume extractor.

Manufactured with the smallest fibers in the industry, ProTura nanofiber filters provide top efficiency and more protection against submicron (0.3 to 0.7 microns) weld-fume particulate. By removing even the smallest breathable particles,

ProTura nanofiber cleans air more thoroughly for a safer, more productive environment — and full OSHA and EPA compliance.

ProTura surface-loading performance captures finer particulate more effectively than standard depth-loading media. As a result, it offers superior release characteristics during pulse-cleaning cycles and lower pressure drop.

By not absorbing hydrocarbons inherent in weld fumes, ProTura filters last longer and reduce disposal costs. For ProTura specifications for your weld-fume extractors, contact Clark Filter at **(800) 327-2247**.

ProTura® nanofiber filtration technology, shown at a magnification of 5,000x.

Ensure a safer, more productive environment with ProTura® Advanced Nanofiber Filters

ProTura® nanofiber filters outperform cellulose and 80/20 media, increasing the performance of your weld-fume extractors:

- **Fibers are up to 50% smaller than competitive fibers** for maximum filtration of submicron particles and lower outlet emissions. Initial efficiency on particles of 0.3 to 0.7 microns is 99%+
- **Surface-loading performance** — particulate easily pulses off the surface layer while the media remains clean, for fewer cleaning cycles and lower stress
- **Replacement and disposal costs are lower**
- **No hydrocarbon absorption** for longer filter life, and no need for pre-coating
- **Availability for Lincoln Electric and most other weld-fume extractors**
